

# Dual-purpose Heat Transfer Fluids for Concentrated Solar Power

Dileep Singh

May 18, 2011

CSP Program Review

Project Start Date: March 5, 2010

# Project Rationale

*“...to make Concentrated Solar Power (CSP) cost competitive in the intermediate power markets by 2015 (~\$0.07/kWh with 6 h storage ) and in baseload power markets (\$0.05/kWh with 16 h storage) by 2020....”* Source: DOE –SETP website

## **Potential technology areas identified for CSP to realize cost reductions**

- Receiver technology
- Concentrator design
- Advanced High Temperature Fluids (HTFs) with enhanced thermal properties
- Thermal energy storage
- Plant size

Solar trough

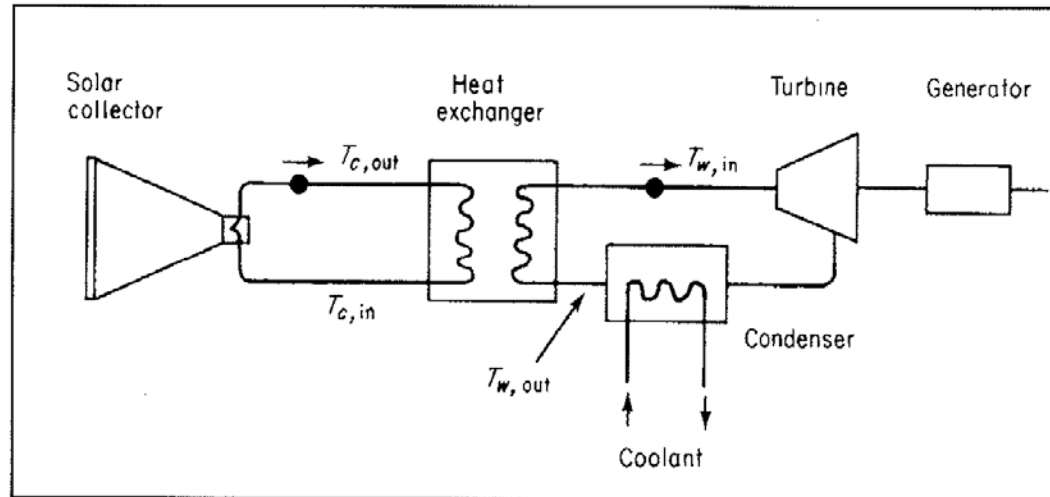

Silica/Therminol  
nanofluid

# Project Objective

- ***The goal of the project is to develop advanced HTFs by incorporating multifunctional engineered nanoparticles. The advanced HTF as a single medium will play the role of an enhanced heat transfer fluid and as a thermal storage system.***
- ✓ Use simulations/modeling to identify candidate materials systems that will provide enhanced thermal properties to HTFs and thermal storage
- ✓ Develop processing routes to fabricate the appropriate nanoparticles of the selected material system(s) and particle design, and incorporate them in commercial HTFs
- ✓ Validate the improved behavior of the advanced HTFs by extensive laboratory scale testing
- ✓ Simulation of heat transfer enhancement and overall improved performance
- ✓ Demonstrate the performance of the advanced HTFs on a test bed in collaboration with a commercial partner/national lab
- ✓ Transfer technology to a commercial partner

# Background

**Schematic of Various Components of Solar to Electric Energy Generation**

- Overall efficiency of solar Rankine cycle depends on  $T_{w,in}$
- A higher  $T_{c,out}$  will result in higher  $T_{w,in}$ ; hence higher system efficiency
- Minimizing the temperature drop from pipe wall to HTF on the collector side will enhance  $T_{c,out}$
- Higher  $T_{c,out}$  can be achieved with a HTF with increased density, improved thermal properties (conductivity, heat transfer, specific heat)

**Storage of thermal energy in HTF will provide added advantage**

## HEAT TRANSFER MECHANISMS IN NANOFLUIDS -- EXPERIMENTS AND THEORY --

S Kabelac, J F Kuhnke

Nanofluids: fluid in which nanometer-sized particles are uniformly suspended

### Effective Medium Theory

- Spherical particles of high thermal conductivity  $k_1$  suspended in fluid of low thermal conductivity  $k_0$ , with volume fraction  $\varphi \ll 1$

$$\frac{k_{eff}}{k_0} = 1 + \frac{3(k_1 - k_0)}{k_0 + k_1} \varphi \approx 1 + 3\varphi$$

conductivity does NOT depend on:

- particle material ( $k_1 \gg k_0$ )
- particle size
- temperature

# Nanofluids are multivariable systems - Challenges

# Efficiency of Nanofluids

$$h = \frac{\Delta Q}{A\Delta T}$$

where

- $h$  = heat transfer coefficient, W/(m<sup>2</sup>K)
- $\Delta Q$  = heat input or heat lost,
- $A$  = heat transfer surface area, m<sup>2</sup>
- $\Delta T$  = difference in temperature between the solid surface and surrounding fluid area, K

## Property Based Figures of Merit : laminar and turbulent flow

$$\left. \begin{aligned} \frac{k_{nf}}{k_0} &= 1 + C_k \phi \\ \frac{\eta_{nf}}{\eta_0} &\approx 1 + C_\eta \phi \end{aligned} \right\} \left\{ \begin{array}{l} C_\eta / C_k < 4 \end{array} \right.$$

Prasher R. et al., Appl. Phys. Lett. **89**, 133108 (2006).

$$M = \frac{\rho^{0.8} c_p^{0.3} k^{0.6} \eta^{0.4}}{\eta^{0.4} \eta^{0.4}} ; Mo_{nf}/Mo_0 > 1$$

W. Yu et al., Appl. Phys. Lett., 96, 2010, 213109

# Experimental Protocol

- Optimization of material properties for nanofluid development

Rotational  
Viscometer

- Testing of nanofluid performance at various temperatures

# Comparison of experimental data and estimation from the Figure of Merit (turbulent flow) for EG/H<sub>2</sub>O (50/50)

Particle Size Effect

Particle Concentration Effect

# Accomplishments

## *Cu nanoparticles in Therminol HTF*

- Chemical process
- Phase pure Cu nanoparticles synthesized
- Nanoparticles size ~ 150-200 nm (dynamic laser scattering)

Phase pure copper synthesized and dispersed in  
Therminol

# Accomplishments

## Thermal Conductivity of Therminol HTF with Cu Nanoparticles

Enhanced Thermal Conductivity  
Stable fluid

*Long-term stability of the fluids is important*

# Accomplishments

## Heat Transfer Measurements of Cu Nanoparticles in Ethylene Glycol

- Heat transfer measured in laminar regime
- Results consistent with thermal conductivity enhancements

# Accomplishments

## *High Resolution TEM of Core/Shell Nanoparticles*

# Accomplishments

*TEM image of core/shell nanoparticles after several melting/freezing runs*

**Before**

**After**

# Accomplishments

Investigation on silica dispersion nanoparticles  
In Therminol

Commercial 10-20 nm particles

Dispersed in Therminol using surfactant

# Accomplishments

## Investigation on silica nanoparticles in HTF

### Optimization of surfactant content

### Differential Scanning Calorimetry

# Accomplishments

## *Pumping Power, Pressure Drops & Erosion*

Torque measurement and  
Data logger hidden behind

# Summary

- The goal of the project is to enhance the thermal properties (heat transfer & storage) of HTFs by incorporation of multifunctional nanoparticles.
- Copper nanoparticles synthesized and dispersed in Therminol. Increased thermal conductivity and heat transfer property (in laminar regime) over the base fluid.
- Core/shell nanoparticles synthesized and dispersed in Therminol. Structural evaluation completed. Stability of the core/shell nanoparticles demonstrated.
- Investigation to optimally disperse  $\text{SiO}_2$  nanoparticles in Therminol completed.
- Test rig to evaluate mechanical effects of the nano-HTF completed.

# Future Work

- Establish stability of the copper/Therminol HTFs for higher particle concentrations and conduct thermal property measurements
- Conduct detailed thermal analysis (heat transfer & calorimetric) on the core/shell nanoparticles dispersed in Therminol
- Establish durability of the nanoparticles and optimize their melting/recrystallization behaviors
- Synthesize metallic/intermetallic core/shell nanoparticles and disperse them in salt based HTFs (Hitec XL)
- Conduct thermo-physical characterizations on the salt based nano-HTFs; investigate performance & durability
